

Improving operations with a scheduler function

The scheduler function allows users to automate certain activities such as updating files and conducting specific operations.

Before

Do you perform certain activities at the same time each week?

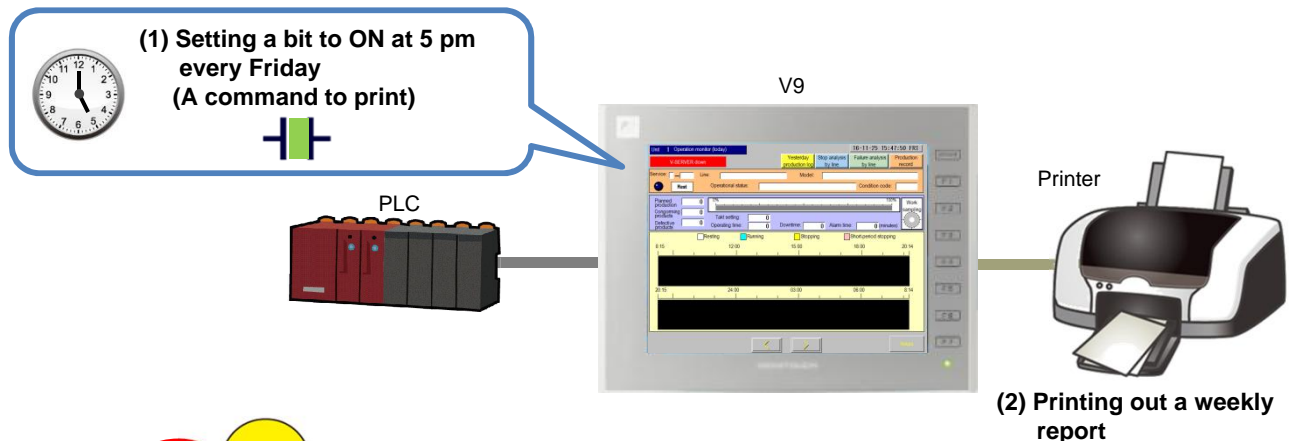

Some production site workers are in the habit of manually printing weekly reports every Friday at 5pm...

Using the scheduler function...

After

Printing can be scheduled to occur automatically at 5pm every Friday.

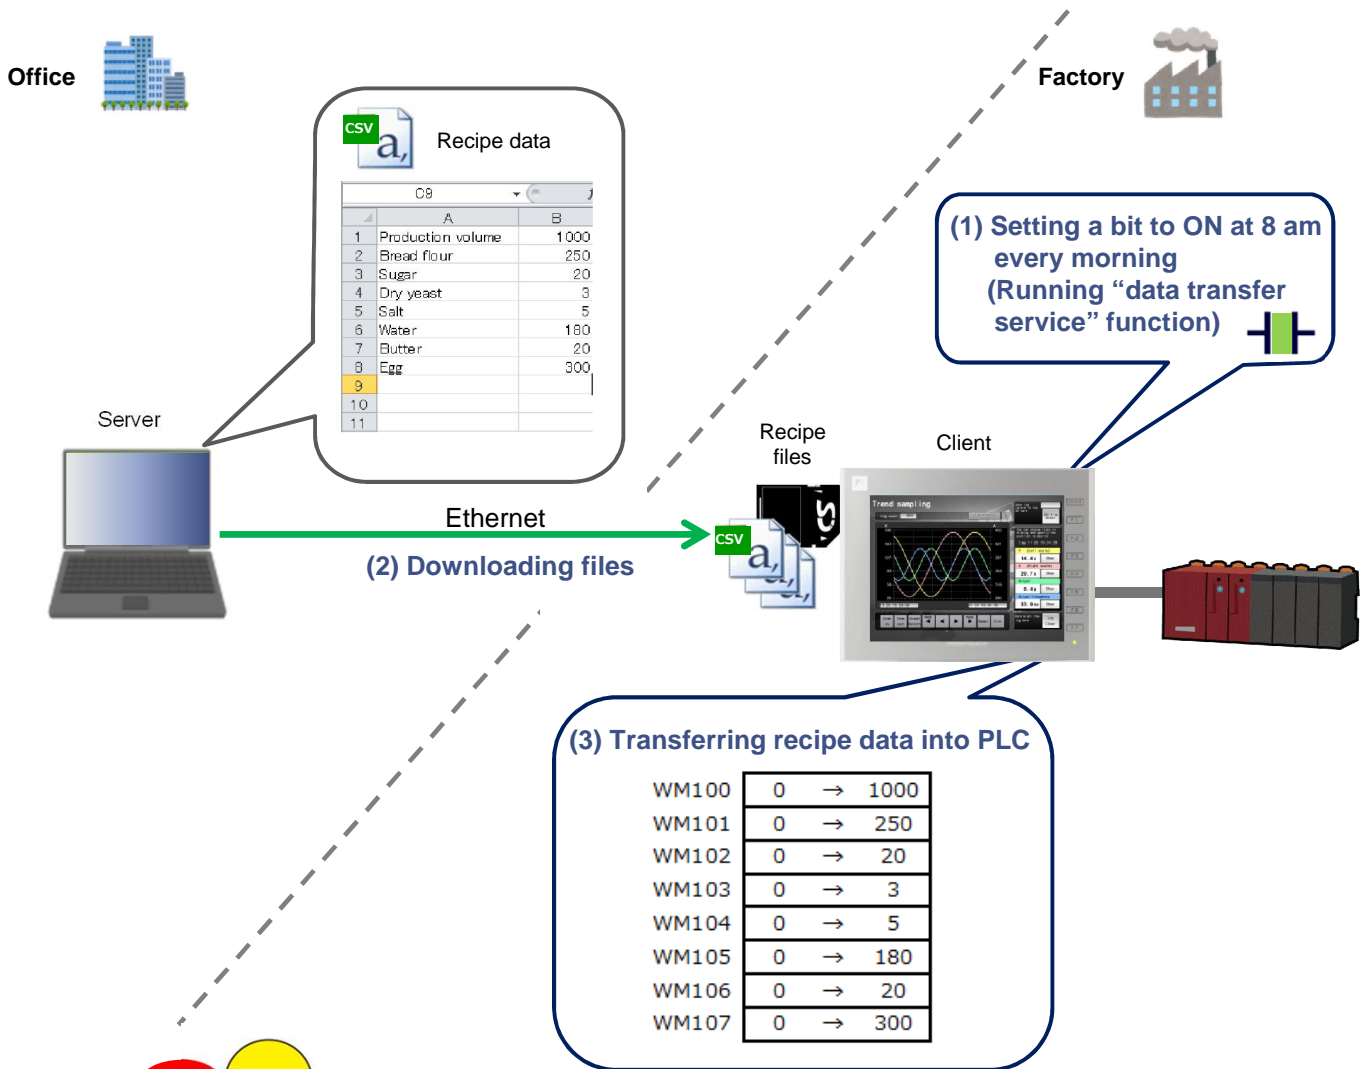

The scheduler function helps avoid human error, thereby ensuring that important activities are not overlooked.

Alternate Uses for the Scheduler Function

Automatic Updates of Recipe Data

If the scheduler function is used with a data transfer service function, V9 can automatically read production data (recipe data) from a PC at office and transfer them to PLC at set time.

E.g.) Updating recipe files at 8 am every morning.

Reduce man-hours by using the scheduler function to automate operations and update files by transferring them automatically from PC to PLC.

Would you like to automate operations by the scheduler function?
